### Chapter 1

## **Template**

### 1.1 How to compile a . tex file to a .pdf file

#### **1.1.1** Tools

To process the files you (may) need:

- pdflatex (for example from tetex package ≥ 0.9-6, which you can get from Red Hat 5.2);
  - acroread (a PDF viewer, available from <a href="http://www.adobe.com/">http://www.adobe.com/</a>);
  - ghostscript ≥ 5.10 (for example from Red Hat Contrib) and

ghostview or gv (from RedHat Linux);

• efax package could be useful, if you plan to fax documents.

#### 1.1.2 How to use the tools

Follow these steps:

- 1. put all source .tex files in one directory, then chdir to the directory (or put some of them in the LaTEXsearch path if you know how to do this);
- 2. run "pdflatex file.tex" on the main file of the document three times (three to prepare valid table of contents);
  - 3. to see or print the result use acroread (unfortunately some versions of acroread may produce PostScript which is too complex), or
